

What is the Tiny Language Tool?

The TinyTaalTool is carried out online by certified TinyEYE speech therapists. They screen to identify whether the child has reached the required language milestones.

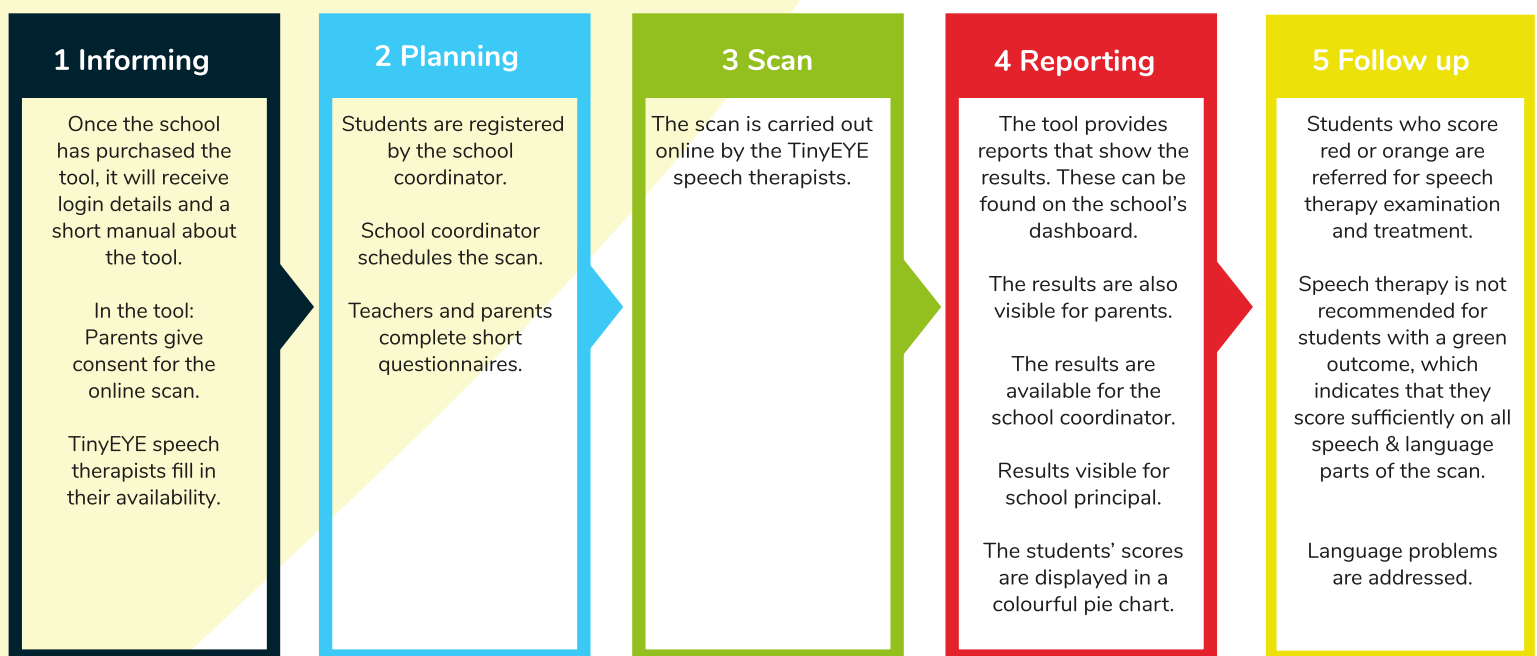

The speech therapists use the tool to map out where the obstacles in speech and language development lie. This makes the process of early identification more efficient.

How does it work?

The Tiny Language Tool is carried out online during school time via the TinyEYE platform. The scan takes 12 minutes per child and generates the results in the form of a score and pre-diagnosis.

The pre-diagnosis also identifies which child has the most urgent need for speech and language support.

You will have the results and follow-up within 5 steps!

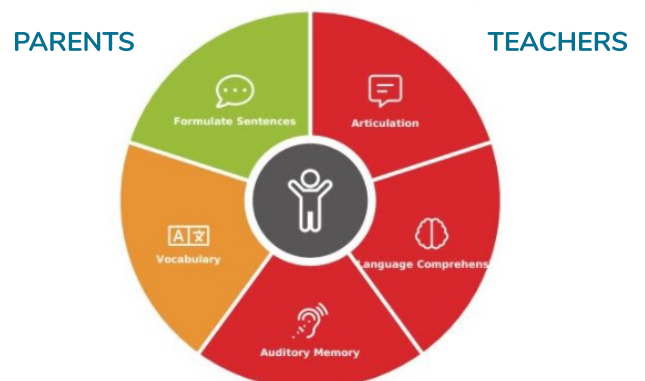

Identify language delays in time

School-age children can experience various communication problems. It's important to identify these at an early age.

Some children have a language delay or disorder. They may have limited vocabulary, difficulty formulating sentences or understanding tasks. Others may have trouble pronouncing sounds, sound combinations or they stutter.

Some others might have vocal problems. All the above can negatively affect the child's school performance.

LANGUAGE SPECIALIST

Hi! My name is Elisa.
