

Online speech therapy allows the patient to receive treatment in the home environment.

Communication for patients who had a CVA (stroke) can be very challenging. Especially for those who develop aphasia. Aphasia is an acquired language disorder due to brain damage. People with aphasia may have difficulty in speaking, understanding, reading, and/or writing. Overall communication is often difficult. Speech therapy plays an essential role in enhancing communication.

How can a nurse help a patient with their speech and language difficulties?

The answer is simple: refer them to TinyEYE!

- Examples of requests for help that the speech and language therapists work with:
- Help to use techniques for finding words easily and thereby be more clear for others.
- Guidance in performing daily writing tasks.
For example: writing shopping lists.
- Learning to distinguish sounds that change the meaning of a word.
For example, "I want a pear" / "I want a bear".
- Learn techniques to follow a conversation more easily.
- Communication advice for family members so that daily conversations run more smoothly.
- Using tools such as picture communication books.

Is it reimbursed?

TinyEYE online speech therapy is fully reimbursed by the Dutch health insurances. Ask the health insurer if online speech therapy is reimbursed. An agreed upon quotation can also be arranged between the client and TinyEYE. The first meeting is free.
